

Flying Blind

When visibility goes to zero, pilots rely on instruments to ensure that you get off the plane the same way you got on. Weather also causes problems for solar generation systems for which you need remote monitoring tools to identify and fix faults.

Use SurePoint Analyzer tools for remote troubleshooting.

Install a SolarVu energy portal for each solar PV site which will continuously run analytics on the collected data to warn of identified problems. Then use the SurePoint Analyzer tools to determine which equipment needs attention to decide whether a truck roll is required. Keep your systems running at maximum output by receiving timely fault warnings without wasting money on routine checks when the system is operating normally.
